

Getting to know a new city can be daunting. One way to get a feel for a city is eating at restaurants, but you won't learn much from going to a single establishment. If you really want to learn more about a city, there are few better options than stopping for small plates at several restaurants. It's even better if you skip the Uber and walk from place to place. There are many apps that will tell you how to get to a restaurant, but few that help you plan an night out. This paper illustrates an attempt to use machine learning to group restaurants by location to create several experiences, each of which can be an excuse to explore a different part of the city.
